Press release February 2010

We want to give you some informations about the latest releases from D16 Group.

SilverLine update and new product!

We have finished a major update of the complete SilverLine series. This major update has focused mainly on implementing new features in the effects and making them fully compatible with MacOSX Snow Leopard (10.6.x).

We've added a completely new product to the SilverLine collection. SYNTORUS is a Double Path Analog Chorus with a rich analog sound similar to the effects found on classic synthesizers like the Solina, Synthex or Juno. It has two perfectly emulated analog delay Lines which add a deep and full sound to any source. Bucket-Brigade Device (BBD) emulation, built-in tremolo effect and complete synchronization of LFOs are only a few of its features. More information about Syntorus is available at:

<http://www.d16.pl/syntorus>

As mentioned, all SilverLine plug-ins have been updated. A few of the most important changes are as follows:

DEVASTOR – Multiband Distortion Unit

We've added some new features:

- New parameter with 6 predefined distortion functions.
- Dry/Wet parameter.
- Processing quality settings
- Ability to turn off the filters

Devastor's CPU load is now 25% less.

FAZORTAN – Controllable Space Phaser

LFO sections were expanded with tempo synchronization parameters. This gives the user many more possibilities for sound processing. Fazortan's CPU usage has decreased by about 15%.

DECIMORT – High Quality Bit Crusher

Filter sections have been expanded with filter order parameters. Decimort's CPU usage has been optimized by 25%.

REDOPTOR – Vintage Tube Distortion

We've added new switch which allows the Hi Cut filter to be switched off. This small change

was requested by many users. We've also optimized Redoptor's CPU load by 30% (in average).

We have also improved many aspects of the sound processing, fixed all issues and harmonized functionality of all SilverLine plug-ins.

All of them now have a common preset management system and midi learn functionality. Default resources, like presets or Midi CC mapping, can be defined and loaded at plug-in startup ... and many many more.

What's next...

We are finishing the Phoscyon update. It's our biggest update ever. The long awaited AU version will come with many new features and improvements.

Phoscyon will sound better due to many changes in the synthesis. It will also work better and benefit from the addition of the standard functions found on the rest of the D16 plug-ins. This update will definitely add new freshness to our first plug-in.

There will be 303 reasons to have it :) The update is planned on Feb 15th.

We are also continuing work on Shioitor, our advanced synthesizer with multilayer architecture and a perfectly emulated warm analog sound. It has many more features than originally announced which we will detail soon.
